

6 Types of LLMs Used in AI Agents

Amer Hussein | AI/ML Engineer | [linkedin.com/in/aamero](https://www.linkedin.com/in/aamero) • Daily AI/ML insights

1 GPT

Generative Pre-trained Transformer

General-purpose models trained on large-scale text data to generate human-like responses across writing, reasoning, coding, and conversation.

Versatile across domains & tasks

Learns broad patterns at scale

Strong foundation for downstream use

2 MoE

Mixture of Experts

Models route each input to a subset of specialized experts instead of using the full model every time, improving efficiency and scaling to very large parameter counts.

Higher compute efficiency

Scales to trillions of parameters

Specialization without sacrificing performance

3 VLM

Vision-Language Model

Lnkd:@aamero

Combines visual understanding with natural language processing to reason over images, diagrams, videos, and other modalities.

Understands Visual content deeply

Aligns language & vision representations

Enable rich multimodal tasks

4 LRM

Large Reasoning Model

Optimized for multi-step reasoning, planning, and logical problem solving with explicit verification and self-correction.

Stronger reasoning & planning

Better reliability through verification

Handles complex problems effectively

5 SLM

Small Language Model

Lightweight, efficient models optimized for speed, cost, and privacy on edge devices or restricted environments.

Low Latency & fast inference

Cost-effective & efficient

Privacy-preserving & on-device

6 LAM

Large Action Model

Designed to take actions in the real world using tools, APIs, and environments—enabling autonomous agents that plan, act, and adapt.

Real-world action & execution

Integrates with tools & external systems

Adapts from feedback & outcomes
